

The Unique Benefits of Working with a Retina-Specialty CRO

ORIGINALLY PUBLISHED JUL 18, 2023 | INFOCUS INSIGHTS

Clinical research is an important part of healthcare development, and retinal disorders are no exception. Research into age-related macular degeneration (AMD), geographic atrophy, diabetic macular edema, and inherited retinal disorders requires expertise in a complex therapeutic area. At InFocus Clinical Research, we believe a retina-specialty CRO can bring a valuable advantage to programs developing treatments for these conditions.

Specialized Expertise and Equipment

The retina is a complex and delicate part of the eye, and diseases affecting it require a specialized approach. Retinal trials call for more than a general understanding of ophthalmology: they require knowledge of retinal pathology, clinical assessments, and evolving treatment approaches. Our team brings considerable experience in ophthalmology, with a focus on retinal disorders, to the management and monitoring of clinical studies.

The equipment used in retinal research also requires specialist knowledge. From optical coherence tomography to fundus photography, familiarity with imaging technologies and study-specific procedures helps teams understand the data being collected, recognize operational challenges, and support consistent execution. That understanding also strengthens communication with investigators and technical staff at research sites.

Therapeutically Trained Staff

At InFocus Clinical Research, we invest in therapeutic training for our team. Staying informed about retinal disease, treatment approaches, and research practices supports the design, execution, and analysis of retina-specific clinical trials. Continued learning helps our staff engage in informed discussions with sponsors and sites and apply their knowledge to the practical work of study delivery.

Proprietary RTI Database

InFocus's proprietary Real-Time Intelligence (RTI) database brings together information on enrollment, contract negotiation, and start-up timelines across a global network of retina research sites. These insights help teams evaluate operational fit and select sites for a particular study.

Efficiency in Trial Design, Participant Recruitment, and Execution

A CRO's role is to support successful, efficient clinical trials. Our retina-focused model connects specialist knowledge to decisions throughout the trial lifecycle, from early planning to execution. Specialist staff and site intelligence help teams plan recruitment and anticipate operational challenges. Relationships with retina sites and key opinion leaders worldwide provide context for study planning, while dedicated teams support reliable data collection and study conduct.

Digital Tools and Integrated Payment Solutions

InFocus uses digital tools to support clinical trial operations, including online study portals, microsites, and mobile resources. Our eVision CTMS/eTMF platform supports study management and trial documentation, helping teams organize operational information and essential records. Integrated participant payment tools can reduce administrative work and support a more convenient study experience. Together, these resources connect technology to the day-to-day needs of the study.

A retina-specialty CRO brings therapeutic focus to the operational work of clinical development. At InFocus Clinical Research, specialist teams, site intelligence, clinical relationships, and digital study support work together to help sponsors advance retinal programs. Choosing a partner with that focus means considering how its knowledge, people, and tools can serve the particular needs of your science.
